CLOTHES LAUNDRY

Laundry is simply the act of washing and straightening ones cloths. For one to carry out effective laundry on his/her clothes, that person would need the following tools and materials:

i. Soap
ii. Detergent
iii. Starch (or any other stiffening agent)
iv. Bleach
v. Bucket(s)
vi. Pressing Iron
vii. Clothes perfume
viii. Water
ix. Special cleaning agents

To begin, one ought to separate the clothes by their colours and materials. Thereafter, one may decide to soak the clothes in only water for some minutes.

Pour some detergents into the water, agitate to foam. Now, one can begin washing. Some clothes require a brush or sponge due to their hardness; some other clothes require that you do not put them in certain detergent solution as such detergents could react with their dyes and change their colours.

After washing, rinse with clean water. After rinsing, squeeze the water off the cloth. Thereafter dry under the sun or in a dryer machine.

If you want your cloth to become stiff you can use a starch or any other stiffening agent to make the clothes stiff. Different kinds of stiffening agents or starch require different methods of application, so it is good practice to go through the method of application on the package or manual of your stiffening agent.

After drying, one can then begin to straighten the clothes. In straightening, we use pressing irons. There are different kinds of pressing irons: charcoal pressing iron, stove pressing iron, and electric pressing

iron. For electric pressing irons, just connect the plug to a live socket and allow to hot. Remember to set the temperature of the iron to the recommended temperature for the cloth you want to press, then begin pressing. While pressing, you can be applying good cloth perfume to give the cloth good fragrance. Thereafter, allow to cool and then store in a good smelling closet, box, or wardrobe.
