HOUSE CLEANING TOOLS AND EQUIPMENT

Since housekeeping skill functions hot only to keep a house clean but also to maintain the structure, we have two classes of tools and equipment used in house-keeping. One class functions to keep the house, i.e. the surfaces in it clean. The class can be called *House Cleaning Tools and Equipment*. The second class functions to check faults in the structure, and are used to remedy such faults. This class can be called *House Maintenance Tools and Equipment*.

Some house-cleaning tools and equipment are as follows:

Dust pan (or packer): this is used to pack the waste/dust/dirt heap gathered through sweeping.

Dust/recycle bin: this is where the waste/dust/dirt of the house that is packed is being thrown temporally before final destruction/disposal.

Broom: this is tool used for sweeping dirt from the house.

Cobweb broom: this is a kind of broom used specially for removing cobwebs from the walls and ceilings.

Mops: these are used for removing dust or stain from the flour using water and detergent.

Brushes: these are used for removing harder stain from surfaces. Some other kind of brushes have handles and can be used in washing toilet basin.

Dusters (small hand toilers): these are little small sized towels that can be used for removing dust from surfaces that a mop can't be used for.
